Aim of this briefing. We present the cumulative number of confirmed cases and deaths \(^1\) from COVID-19 infection in Cayman Islands since the start of the outbreak, which we measure as the number of days since the first confirmed case. We compare the Cayman Islands trajectory against key comparators (Hong Kong, Singapore, Iceland, New Zealand), all island territories that are further along their epidemic curves. Outbreak progress is likely to vary markedly between countries, and this graphic is presented as a guide only.

<table>

</table>

The first graph shows the rise in the absolute numbers of cases and deaths in Cayman Islands since the start of the outbreak. It is good for assessing the extent of the COVID-19 burden, when thinking about healthcare demand for example.

Graph. Cumulative cases and deaths in Cayman Islands as of 31 Jul 2020 (133 outbreak days)

The second graph shows the number of cases on a different scale (called a logarithm scale). It shows us the growth rate over time, and is good for comparing progress against other countries.

Graph. Cumulative cases in Cayman Islands as of 31 Jul 2020, with international comparisons
